## The early universe wasn't nearly as pristine as scientists thought

New research led by astronomers at the University of Arizona challenges previous assumptions about the early universe's composition. Observations using NASA's James Webb Space Telescope reveal that some of the first galaxies, visible as they were just 500 million years after the Big Bang, were already dispersing heavier elements like carbon and oxygen into the surrounding space. By examining light absorption patterns from distant galaxies, scientists found that these heavy elements were moving outward, enriching intergalactic space. This discovery indicates that galaxies were producing and distributing these elements much sooner than expected, seeding future stellar formations. This early dispersion resembles the spread of food dye in water, suggesting that even during the cosmic dawn, galaxies were actively contributing to the universe's chemical diversity. ## The family of Renee Good files lawsuits over her death during Minneapolis ICE raids

The family of Renee Good, a 37-year-old woman fatally shot by an ICE agent in Minnesota, is suing the federal government. They have filed two civil lawsuits: one for wrongful death, alleging that ICE officer Jonathan Ross used excessive force, violating Good's Fourth Amendment rights, and another claiming federal officials conspired to violate civil rights. This second lawsuit invokes the Ku Klux Klan Act of 1871, arguing that Good's death was a deliberate outcome of an immigration enforcement campaign targeting Hispanic and Somali communities. Defendants include Ross and several high-ranking officials. Renee's partner, Becca Good, who witnessed the incident, expressed her grief, highlighting the loss of a loving partner and mother of three. (NBC)

## Mulberry may reshape gut bacteria and influence metabolism

Mulberries have long been used in food and traditional medicine, but recent research is exploring their impact on gut microbiota and metabolism. Compounds like polyphenols and polysaccharides in mulberries, especially white (*Morus alba*) and black (*Morus nigra*) varieties, may alter gut bacteria and improve metabolic health. The effectiveness of mulberry preparations varies based on species, plant parts used, and processing methods. Studies have shown that complex preparations combining polyphenols and polysaccharides can enhance gut health and metabolic markers in high-fat diet-fed mice. These findings highlight the importance of considering the intricate composition and interactions of mulberry compounds for specific health benefits. (Science Daily)

## Strange rock catches scientist's eye during creek search, leading to rare discovery

A recent discovery in a California creek has revealed a fascinating glimpse into the past: a tooth from an ancient Pacific mastodon. Found by geomorphologist Brigid Lynch during a survey for the threatened California red-legged frog, the tooth is in pristine condition, indicating it hasn't moved much since the mastodon's death. Wayne Thompson, CEO of Pacific Paleontology, estimates the tooth is between 50,000 and 100,000 years old, challenging earlier reports suggesting it was just 10,000 years old. The well-preserved state of the tooth's roots suggests the rest of the animal might still be nearby, offering exciting potential for further exploration. (Science Daily)

## New "plant armor" more than triples strawberry yields

Plant Armor, a newly developed textile covering, has revolutionized strawberry production by tripling fruit yield in tunnel field trials without harming plant health. This innovative fabric, designed to encase strawberry plants, acts as a barrier against insects while permitting essential sunlight, rain, and air to pass through. Contrary to expectations, Plant Armor did not reduce light availability, allowing for a significant increase in fruit production. It also provided a consistent warming effect, enabling plants to reach the fruiting stage earlier by optimizing growing degree-days. Originally based on research for military textiles, Plant Armor's transition to agriculture highlights the benefits of cross-disciplinary collaboration. It demonstrates a promising avenue for reducing water usage and pesticide reliance in strawberry farming, showcasing how unexpected applications can emerge from diverse research efforts. ## Curry de Peixe

### Ingredients

- 250 grams Penne pasta
- 200 grams Paneer, cubed
- 150 grams Fresh spinach
- 1 medium Onion, finely chopped
- 2 Garlic cloves, minced
- 1 tablespoon Ginger, grated
- 400 grams Crushed tomatoes
- 2 teaspoons Garam masala
- 1 teaspoon Turmeric powder
- 30 ml Olive oil

1. Cook penne pasta according to package instructions until al dente. Drain and set aside.
2. Heat olive oil in a large pan over medium heat. Add chopped onion and sauté until translucent, about 5 minutes.
3. Add minced garlic and grated ginger, cook for another minute until fragrant.
4. Stir in garam masala and turmeric powder, cook for 30 seconds, stirring constantly.
5. Pour in crushed tomatoes, bring to a simmer, and cook for 10 minutes, allowing the sauce to thicken.
6. Add cubed paneer to the sauce and gently stir. Cook for 5 minutes.
7. Add fresh spinach to the pan and cook until wilted, about 2-3 minutes.
8. Toss the cooked penne pasta with the masala paneer and spinach sauce.
9. Season with salt and pepper to taste. Serve immediately.
