NASA Welcomes Record-Setting Artemis II Moonfarers Back to Earth

The first astronauts to the Moon in over 50 years have returned to Earth after a record mission with NASA's Artemis II. NASA astronauts Reid Wiseman, Victor Glover, Christina Koch, and CSA astronaut Jeremy Hansen splashed down near San Diego at 5:07 p.m. PDT Friday, completing a journey of nearly 10 days and 252,756 miles.

"NASA is grateful to President Donald Trump and Congress for the mandate and resources that made this mission possible," said NASA Administrator Jared Isaacman. "Artemis II demonstrated extraordinary skill, courage, and dedication, pushing human exploration farther than ever before. This crew accepted significant risk for the knowledge gained and the future we are determined to build. NASA acknowledges our workforce and international partners, whose expertise was essential. With Artemis II complete, focus now turns to assembling Artemis III and preparing to return to the lunar surface." (NASA)

Anthropic's Mythos AI can spot weaknesses in almost every computer on earth. Uh-oh.

Anthropic's AI technology, Mythos, has demonstrated exceptional proficiency in identifying software vulnerabilities, raising significant concerns regarding its potential for misuse. If made publicly available, it could serve as a formidable tool for cybercriminals. Mythos has already uncovered thousands of weaknesses within major operating systems and web browsers, prompting alarms about potential attacks on critical infrastructure, including banks and hospitals.

To address these risks, Anthropic is collaborating closely with select companies, such as Amazon and Apple, through an initiative known as Project Glasswing. This partnership aims to strengthen defenses against cyber threats. Security experts stress that the advent of AI tools like Mythos highlights the urgent necessity to prepare for sophisticated cyber threats, as AI capabilities may significantly outpace those of human hackers, thereby presenting a substantial challenge to cybersecurity. Scientists finally crack mystery of rare COVID vaccine blood clots

Researchers from Flinders University and international collaborators have identified how a rare blood clotting condition can arise from certain COVID-19 adenovirus-based vaccines or natural adenovirus infections. The immune system can mistakenly confuse an adenovirus protein with the human blood protein platelet factor 4 (PF4), leading to the production of antibodies that trigger clotting. While this reaction is rare, understanding its cause allows for modifications to adenovirus proteins to enhance vaccine safety. Dr. Jing Jing Wang noted that altering this protein can prevent the reaction while maintaining vaccine effectiveness. This research contributes to the understanding of vaccine-induced immune thrombocytopenia and thrombosis (VITT), first observed during the COVID-19 pandemic. (Source: Science Daily)

Ostrich on a side quest: runaway big bird sprints on Thai highway

In a scene straight out of a quirky wildlife movie, a six-month-old ostrich named B1 decided to test his speed on a bustling highway in Chonburi, Thailand! The feathered speedster was eventually scooped up and safely returned to his cozy digs at an animal café. Motorist Chairat Sompong captured the wild adventure on film, noting B1 seemed a bit shell-shocked by all the honking and zooming cars. After a 15-kilometer joyrun, the runaway was finally rounded up. Apparently, the ruckus from a delivery truck triggered B1's great escape. Itsara Boriboon, B1's doting owner, was understandably worried about his little sprinter and promised to beef up security to keep future escapades at bay. B1 and his buddy, B2, were snatched up for 15,000 baht (\$460) just five months ago—making their highway antics quite the pricey performance! (Source: CBS)

A 67-year-old "crazy" theory about vitamin B1 has finally been proven

Chemists have stabilized a highly reactive carbene molecule in water, confirming a 67-year-old theory about vitamin B1 (thiamine) that suggested it might form a carbene-like structure to facilitate biochemical reactions. This breakthrough resolves a long-standing puzzle and indicates cleaner methods for pharmaceutical production. The researchers successfully created and isolated a stable carbene, which remained intact for months, marking the first observation of such a molecule in water. This achievement supports Ronald Breslow's 1958 hypothesis by utilizing a protective structure to shield the carbene from instability, allowing for detailed analysis. The implications of this discovery extend far beyond validating historical theories. By stabilizing carbenes in water, scientists can now explore new avenues for drug synthesis and development with increased efficiency and reduced environmental impact. This could lead to more sustainable practices in the pharmaceutical industry, as well as open up possibilities for novel therapeutic agents. Additionally, the methods developed through this research could inspire similar approaches for stabilizing other reactive intermediates, potentially revolutionizing chemical synthesis across various fields. This milestone not only honors the foresight of pioneers like Breslow but also paves the way for future innovations in chemistry and medicine.

Chicken Carbonara

Indulge in the creamy, savory delight of Chicken Carbonara, a modern twist on the classic Italian favorite. This recipe combines tender chicken with rich, velvety sauce, crispy pancetta, and perfectly cooked pasta, creating a meal that's both comforting and elegant. Whether for a cozy family dinner or a special occasion, this dish promises to impress with its irresistible flavors.

Ingredients

- 3 large eggs
- 3/4 cup grated parmesan cheese, plus more for serving
- 1/2 cup heavy cream
- 1 tsp. black pepper, plus more to taste
- 4 slices thick-cut bacon, diced
- 1 lb. skinless, boneless chicken breasts, sliced crosswise into 1/2-inch-thick strips
- 1 tsp. kosher salt, plus more for the pasta water
- 2 garlic cloves, minced
- 12 oz. fettuccine or linguine
- 1/2 cup frozen peas
- Chopped fresh parsley, for garnish

Directions

- Whisk together the eggs, parmesan, heavy cream and 1/2 teaspoon pepper in a medium bowl. Set aside.
- Cook the bacon in a large skillet over medium heat, stirring frequently, until crispy and the fat has rendered, 5 to 7 minutes. Use a slotted spoon to transfer the bacon to a paper towel-lined plate.
- Increase the heat to medium-high. Add the chicken to the drippings in the skillet, season with the salt and remaining 1/2 teaspoon pepper and cook, tossing occasionally, until browned and cooked through, 6 to 8 minutes. In the last minute of cooking, stir in the garlic. Transfer the chicken to a plate; do not wipe out the skillet.
- Meanwhile, bring a large pot of salted water to a boil. Add the pasta and cook according to the package directions, adding the peas during the last minute. Reserve 1 cup cooking water, then drain.
- Immediately add the hot pasta and peas to the skillet off the heat. Pour in the egg mixture and quickly toss with tongs, adding 2 to 3 tablespoons of the reserved cooking water, until the sauce is creamy. If the sauce is too thick, add more of the reserved cooking water. If it's too thin, cook over low heat until thickened.
- Stir in the bacon and chicken. Garnish with parsley, pepper and parmesan.
