Hawaii patients may soon get prescriptions for fresh food from doctors

The Food Is Medicine program in Hawai'i seeks to tackle chronic diet-related health issues by allowing Medicaid recipients to receive prescriptions for fresh food, including local produce and proteins. This initiative not only aims to improve health outcomes by addressing food insecurity but also intends to invigorate the local agricultural sector, potentially injecting significant funds into the economy and creating new jobs. By prioritizing local sourcing, the program aspires to offer fresher, culturally relevant food options. The success of pilot programs, like the one that helped Moses and Suzette Paio enhance their health, underscores the potential benefits. As Hawai'i joins other states in this innovative approach under the Social Security Act's 11-15 waiver, ongoing studies will further evaluate its impact on public health. The program's success hinges on the collaboration between healthcare providers and local farmers, ensuring that at least 15% of produce and protein come from local sources, setting it apart from other states and emphasizing the importance of fresh, nutritious food.

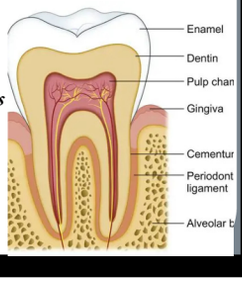

A clever molecular trick unlocks previously impossible properties in glass

Scientists have made a groundbreaking discovery in glass manufacturing, allowing for unprecedented control over its properties by altering its internal structure during production. This innovation, developed by a collaboration between TU Dortmund University, Paderborn University, the University of Duisburg-Essen, and the University of Oxford, was published in Nature Materials. By incorporating a molecule called 1,10-phenanthroline during the melting process, researchers can manipulate chemical bonds in metal-organic framework compounds (MOFs), enabling the creation of glass with unique characteristics like magnetism and light emission. This method lowers the melting temperature, preventing damage and impurities, and opens the door to advanced applications in fields like gas storage, batteries, and optical technologies. The introduction of phenanthroline not only aids in melting but also actively restructures the glass by altering the coordination environment of metal atoms. This molecular trickery transforms the molten state into a reactive space, allowing scientists to design glass with tailored properties for sensors, catalysts, and optoelectronic devices, revolutionizing the potential of glass materials.

Breakthrough gel could fix cavities

The groundbreaking development of a new gel capable of regenerating tooth enamel marks a promising leap in dental care. Unlike bones, tooth enamel cannot naturally regenerate, but researchers from the University of Nottingham have created a material that can rebuild this protective layer. Inspired by the biological processes of enamel formation in childhood, the gel uses proteins that guide enamel growth and forms a durable coating on teeth. This coating utilizes calcium and phosphate ions from saliva to foster epitaxial mineralization, allowing new mineral crystals to align with existing enamel. The gel also addresses tooth sensitivity by forming an enamel-like layer over exposed dentin, reducing discomfort and improving dental restorations. Initial tests suggest that the regenerated enamel matches the durability and mechanical strength of natural enamel, offering a potential solution to the global challenge of enamel deterioration and tooth decay.

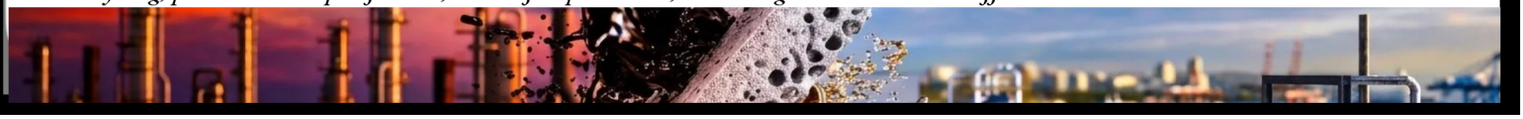

Treasure hunter strikes gold with 1,000-year-old discovery linked to 'Hand of God'

Nick Berry, a metal detectorist from Northampton, England, uncovered a rare 1,000-year-old gold pendant believed to symbolize the "Hand of God." Discovered on farmland near Highclere Castle, the artifact, traced back to the ninth or 10th century, is thought to have belonged to a high-status individual. The hand-shaped pendant, with its symbolic religious significance, aligns with similar imagery on late Saxon and Viking-era coins. Berry, who reported his find for evaluation, could receive compensation based on its market value if acquired by a museum. Experts suggest the piece could be worth a substantial sum.

Scientists discover that a clogged filter could revolutionize oil refining

The development of a new membrane technology for crude oil separation represents a groundbreaking advancement in reducing energy consumption and carbon emissions in oil refining. Led by researchers from KAIST and Georgia Tech, the innovation uses a porous polyacrylonitrile (PAN) membrane to create natural filtration channels within the crude oil itself. This approach eliminates the need for expensive coatings and takes advantage of what is typically considered a disadvantage—fouling—by using it to enhance separation efficiency. The adoption of this membrane has the potential to cut energy use by nearly a third and significantly reduce greenhouse gas emissions. Beyond oil refining, this technology could also be applied to various industries, improving processes such as recycling, pharmaceutical purification, and biofuel production, showcasing a versatile and cost-effective alternative to traditional methods.

Molten Provolone Tenderloin with Garam Masala Chimichurri

- - 800g beef tenderloin steaks (4 portions of 200g)
- - 200g provolone cheese, sliced into 4 rounds
- - 15g garam masala spice blend
- - 30ml clarified butter (ghee)
- - 40g fresh flat-leaf parsley, finely chopped
- - 15g fresh oregano leaves, finely chopped
- - 10g garlic, minced
- - 45ml extra virgin olive oil
- - 20ml red wine vinegar
- - 5g flaky sea salt

1. Whisk chopped parsley, oregano, minced garlic, red wine vinegar, olive oil, and a pinch of salt to make the chimichurri sauce. Set aside.
2. Season the beef tenderloin steaks thoroughly with flaky sea salt and coat all sides evenly with the garam masala blend.
3. Heat ghee in a heavy cast-iron skillet over high heat until smoking lightly.
4. Sear the steaks for 3 to 4 minutes per side for medium-rare, basting frequently with the spiced pan juices. Transfer beef to rest.
5. Place the provolone cheese slices directly into the hot residual skillet for 1 minute until bottoms are bubbling and crisp.
6. Top each rested steak with a seared, molten provolone slice.
7. Drizzle the fresh herbal chimichurri generously over the molten provolone and beef, then serve immediately.
