New wild cat species is identified for first time in 100 years, researchers say

Researchers have identified a new species of wild cat called *Leopardus tilcayo*, or the tilcayo tiger cat, marking the first such discovery in a century. Smaller than a house cat, this slender, spotted feline inhabits the Bolivian Yungas, a cloud forest where the Andes meet the Amazon basin. Described in the journal *Current Biology*, this discovery is significant due to the rarity of finding new large mammals. While the exact population size remains unknown, conservation efforts are critical as their habitats are rapidly disappearing. Local communities have long recognized the tilcayo, preserving its traditional name. Genetic testing confirmed its status as a distinct species, having diverged from other tiger cats 1.4 million years ago.

Netflix turns Willy Wonka's chocolate factory into a real-life 'social experiment'

"Wonka's *The Golden Ticket*" on Netflix reinvents the classic tale by embracing both whimsy and cunning, as contestants vie for a \$3 million prize through strategic gameplay. Unlike the original story's moral focus, this series delves into the complexities of human nature and the theme of redemption. Notably, it employs generative AI to replicate Gene Wilder's iconic voice, with approval from his estate, to guide viewers through the competition. The emerging use of generative AI in Hollywood has sparked discussions about AI's increasing role in Hollywood, raising questions about its implications for the entertainment industry from film industry workers. Scientists discover first new penguin species in more than 100 years

The discovery of the southeastern gentoo penguin, *Pygoscelis kerguelensis*, emphasizes the significance of genetic research in understanding penguin diversity. This newly recognized species, living on the remote Kerguelen Islands, is one of four distinct gentoo species identified through a comprehensive genomic study led by international researchers. Unlike the widely known Emperor penguin, these gentoos remained cryptic due to their subtle physical similarities, despite notable genetic differences. The research, published in *Communications Biology*, also reclassifies three other gentoo populations as distinct species, highlighting their vulnerability to climate change, particularly in the sub-Antarctic regions. This study represents a milestone in resolving the century-long debate over gentoo taxonomy, advocating for collaborative conservation efforts across nations to protect these unique penguin species. Hall of Famer Adam Vinatieri kicks world record field goal in Swiss Alps

Adam Vinatieri, a legendary figure in American football, recently added another remarkable achievement to his illustrious career. On a blustery day in the Swiss Alps, the 53-year-old Hall of Famer set a Guinness World Record by kicking the highest field goal ever from an altitude of 3,454 meters (11,332 feet) at Jungfrauoch, the "Top of Europe." Wearing a Patriots jersey, Vinatieri executed the kick on snow-covered ground with swirling winds, similar to the conditions he often faced with the New England Patriots. Having retired in 2019, this historic kick demonstrated his enduring skill. Overcoming challenges posed by the high altitude, Vinatieri expressed immense pride, further cementing his legacy as one of the greatest kickers in NFL history.

Senolytic drugs may help with aging

A promising study published in *Aging (Aging-US)* suggests a drug called ABT-263 might aid in faster wound recovery in older skin by targeting aging, damaged cells. Researchers from Boston University discovered that applying ABT-263 to aged mice skin reduced senescent cells, which often impede healing, and significantly improved wound repair. Senescent cells are those that stop dividing but linger, causing inflammation and hindering tissue repair. ABT-263, a senolytic drug, seeks to eliminate these cells selectively. In tests, aged mice treated with ABT-263 showed improved healing rates, with 80% of their wounds fully healed by day 24 compared to 56% in untreated mice. Interestingly, the treatment also briefly increased inflammation, a beneficial early stage of repair, while boosting genes related to tissue rebuilding. The drug's effects were most pronounced in older skin, highlighting its selective action and potential advantages of topical application over oral delivery. These findings pave the way for potential treatments to enhance wound healing in older adults.

Curry de Peixe

Ingredients

- - 600 grams cod fillets, cut into 4 cm pieces
- - 200 grams cooked black-eyed peas
- - 100 grams cashews, soaked and blended with 50ml water
- - 400 ml full-fat coconut milk
- - 100 grams onions, finely chopped
- - 20 grams ginger-garlic paste
- - 10 grams vindaloo paste
- - 50 grams diced tomatoes
- - 30 ml coconut oil
- - 15 grams fresh coriander, chopped

1. Marinate fish with a pinch of salt and a squeeze of lime for 15 minutes.
2. Heat coconut oil in a large pot over medium heat. Sauté onions until translucent.
3. Add ginger-garlic paste and vindaloo paste, cook for 2 minutes until fragrant.
4. Stir in diced tomatoes and cook until they soften, about 5 minutes.
5. Pour in coconut milk and the blended cashew paste. Bring to a gentle simmer.
6. Add the cooked black-eyed peas and let it simmer for 5 minutes, allowing flavors to meld.
7. Gently place the marinated fish pieces into the simmering sauce. Do not stir vigorously.
8. Cover and cook for 8-10 minutes, or until the fish is opaque and flakes easily.
9. Garnish generously with fresh coriander before serving.
10. Serve hot with steamed rice or crusty bread.
