Argentina defeats England 2-1 after another comeback; Spain awaits in World Cup final

Argentina advanced to its second consecutive World Cup final with a dramatic 2-1 victory over England on Wednesday. The match saw Argentina clinch the win with two late goals. Enzo Fernández headed in the equalizer in the 85th minute, followed by a game-winning header from Lautaro Martínez in stoppage time. Both goals were expertly set up by Lionel Messi's crosses.

The first half was largely uneventful, with neither team managing a shot in the opening 30 minutes—a rarity since the 1966 World Cup broadcast. Instead, the game was marred by fouls, with 19 committed by halftime and no shots on goal. England eventually broke the deadlock in the 55th minute when Anthony Gordon volleyed in a goal from Morgan Rogers' cross. However, England then opted for a defensive approach, allowing Argentina to gather offensive momentum and score their decisive goals.

Argentina will defend its World Cup title against Spain in the final on Sunday. England, which hasn't reached a final since 1966, has no regrets. Manager Thomas Tuchel praised the team's effort, stating they were very close. Harry Kane expressed the sentiment that England is close to success but missing the final piece, having reached the semifinals again after a similar outcome in 2018. (NBC)

Astronomer's name deciphered from ancient Mayan ruins for first time: "White-chested Fox"

Archaeologists have made a groundbreaking discovery at the San Bartolo-Xultun site on the Mexican border, uncovering the name of an ancient Mayan astronomer and mathematician for the first time. Guatemala's Ministry of Culture announced that "White-chested Fox," or Sak Tabu Waax, was identified through transcribed mural symbols dating from 400 BC to 900 AD. This site revealed a unique mathematical and astronomical formula attributed to this individual, marking it as the only known work of its kind from the Maya Classic period.

The discovery was facilitated by analyzing over 50 mathematical and astronomical microtexts on the walls. Researchers used enhanced digital scans and photographs to decipher 11 hieroglyphs, revealing a blend of art, science, and everyday life. The Maya civilization, which began to decline around 900 AD before collapsing with Spanish conquest, continues to intrigue archaeologists. Recent findings include ancient cities and ruins discovered through advanced techniques like aerial laser scanning.

Spain books a spot in the World Cup final with a comprehensive victory over France

The semifinal played out in a manner few could have foreseen. Even the most optimistic Spain supporters anticipated a dominant performance from France. Expectations were for Spain to secure a victory through a late goal or a rare error from the formidable French defense.

However, the match unfolded quite differently. Spain began assertively, controlling possession though not initially troubling the French goalkeeper. As the clock passed 20 minutes, Lamine Yamal's pressure on Lucas Digne resulted in a penalty for Spain. Digne, unaware of Yamal's presence, fouled him, leading to a spot-kick. Mikel Oyarzabal confidently converted, marking his fifth tournament goal.

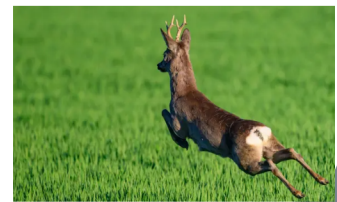

Rather than sparking a French resurgence, the goal invigorated Spain. Early in the second half, Pedro Porro capitalized on a deflection off Dani Olmo to extend Spain's lead. France, surprisingly subdued, offered little threat. Kylian Mbappé's efforts were futile, and the team seemed overwhelmed. Spain celebrated reaching its first World Cup final since 2010, as France faced rebuilding post-Deschamps

Drunk deer runs in circles after eating fermented fruit

Beware of getting a "Deer-U-I"! In a rural French town, a "drunk" deer caused chaos, prompting authorities to caution drivers. The Saône-et-Loire gendarmerie warned of an erratic deer appearing intoxicated after consuming fermented fruit. "In spring, wild animals may consume fermented fruit, leading to unpredictable behavior," they noted on social media. A shared video shows the deer moving erratically. "Not all road users are sober," police humorously remarked. Fermented fruit's sugars convert to ethanol, akin to alcohol in beverages. Intoxicated deer can pose dangers due to sudden crossing and erratic movements, especially at night or on secondary roads. Officers advise slowing down, avoiding sharp turns, and staying vigilant in wooded areas. "If Bambi overindulges, maybe drive cautiously," police suggested. (FOX)

Praearcturus gigas — The World's Largest Scorpion

Experts have recently identified a giant scorpion species known as Praearcturus gigas, which roamed the Earth around 415 million years ago and is believed to be the largest scorpion discovered so far. Led by Dr. Richard Howard of the Natural History Museum, the study unveiled that fossil fragments indicate the scorpion had pincers measuring 16 centimeters and its body stretched to about one meter in length. The fossils were unearthed from the St Maughan's Sandstone Formation, which covers areas in Powys, Wales, and parts of Herefordshire and Worcestershire in England.

The journey to identify this species began in the 1870s with the initial fossil discovery in Herefordshire, followed by subsequent finds in Birmingham in the 1970s and Tredomen Quarry in Powys in the 2010s. For over a century, the fossils' origins were uncertain, with many scientists initially believing they belonged to a giant crustacean. However, modern techniques like CT scans and 3D modeling have confirmed they belong to a giant scorpion, primarily due to a distinctive chest plate that matches a fossil scorpion found in Canada.

Howard noted that while they only have fragments, the scorpion's size is comparable to modern giants like the emperor scorpion, suggesting its impressive scale. This species lived long before the large arthropods of the Carboniferous period, hinting at its unique adaptation to early ecosystems with minimal competition.

Words of Wisdom

Did you know that Taylor swift was named after Albert Einstein?

110 years after.

Classic Wiener Schnitzel

Instructions:

- Prepare the meat: Pound the cutlets to about 1/4-inch thickness to ensure even cooking. Season both sides with salt and pepper.
- Bread the cutlets: Coat each cutlet first in flour, then dip into beaten eggs, and finally coat with breadcrumbs. Press lightly so the breadcrumbs adhere.
- Fry the schnitzel: Heat oil or clarified butter in a large skillet over medium heat. Fry cutlets 2–3 minutes per side, until golden brown. Avoid overcrowding the skillet.
- Drain excess oil: Place cooked schnitzels on paper towels to remove excess oil.
- Serve: Serve immediately with lemon wedges, potato salad, or lingonberry jam if desired.

Ingredients:

- 4 veal or pork cutlets (about 1/4-inch thick)
- Salt and pepper to taste
- 1 cup all-purpose flour
- 2 large eggs, beaten
- 1–2 cups breadcrumbs (preferably fine)
- 1/4 cup vegetable oil or clarified butter for frying
- Lemon wedges for serving
